

Top Earners

We define an employee's *total earnings* to be their monthly *salary* \times *months* worked, and the *maximum total earnings* to be the maximum total earnings for any employee in the **Employee** table. Write a query to find the *maximum total earnings* for all employees as well as the total number of employees who have maximum total earnings. Then print these values as **2** space-separated integers.

Input Format

The **Employee** table containing employee data for a company is described as follows:

Column	Type
employee_id	Integer
name	String
months	Integer
salary	Integer

where *employee_id* is an employee's ID number, *name* is their name, *months* is the total number of months they've been working for the company, and *salary* is the their monthly salary.

Sample Input

employee_id	name	months	salary
12228	Rose	15	1968
33645	Angela	1	3443
45692	Frank	17	1608
56118	Patrick	7	1345
59725	Lisa	11	2330
74197	Kimberly	16	4372
78454	Bonnie	8	1771
83565	Michael	6	2017
98607	Todd	5	3396
99989	Joe	9	3573

Sample Output

```
69952 1
```

Explanation

The table and earnings data is depicted in the following diagram:

employee_id	name	months	salary	earnings
12228	Rose	15	1968	29520
33645	Angela	1	3443	3443
45692	Frank	17	1608	27336
56118	Patrick	7	1345	9415
59725	Lisa	11	2330	25630
74197	Kimberly	16	4372	69952
78454	Bonnie	8	1771	14168
83565	Michael	6	2017	12102
98607	Todd	5	3396	16980
99989	Joe	9	3573	32157

The maximum *earnings* value is **69952**. The only employee with *earnings* = **69952** is *Kimberly*, so we print the maximum *earnings* value (**69952**) and a count of the number of employees who have earned **\$69952** (which is **1**) as two space-separated values.

-- InCorrect

```
SELECT MAX(months * salary) || ' ' || COUNT(MAX(months * salary)) FROM Employee
```

-- Correct

```
SELECT
    (salary * months) AS earnings
    , COUNT(*)
FROM
    Employee
GROUP BY
    earnings
ORDER BY
    earnings desc
LIMIT 1
;
```
